Lilly Bridge - History

Built in 1950 by Virginia Bridge Company, Lilly Bridge spans Bluestone Lake in Summers County, WV, and is one of only seven remaining cantilever truss bridges in the state. Constructed as part of the Flood Control Act to build the Bluestone Dam, Lilly Bridge is recognized by the National Register of Historic Places.

The bridge was built around the same time as the Bluestone Dam when about 50 families were forced to move because the federal government worried that the creation of the dam would flood the Village of Lilly, hence the name the Lilly Bridge.

According to the Lilly Family History records, Lilly was a Village at the Bluestone and Little Bluestone Rivers in Summers County settled in 1772. “It was said that they came here with a rifle, a bible and an axe to settle this rugged area,” National Park Ranger Teena Lilly said in the West Virginia Public Broadcasting documentary “Three Rivers”. “The graves were exhumed, families were moved, and homes were torn down because they believed that Lilly would be under water.”

Very little remains of the actual village since the Federal Government forced residents off the land. The family is left with the bridge and a monument to remember their homeland. The new bridge will keep the Lilly name.

1948 Pier Construction

Bluestone Bridge - second construction (ca 1948)

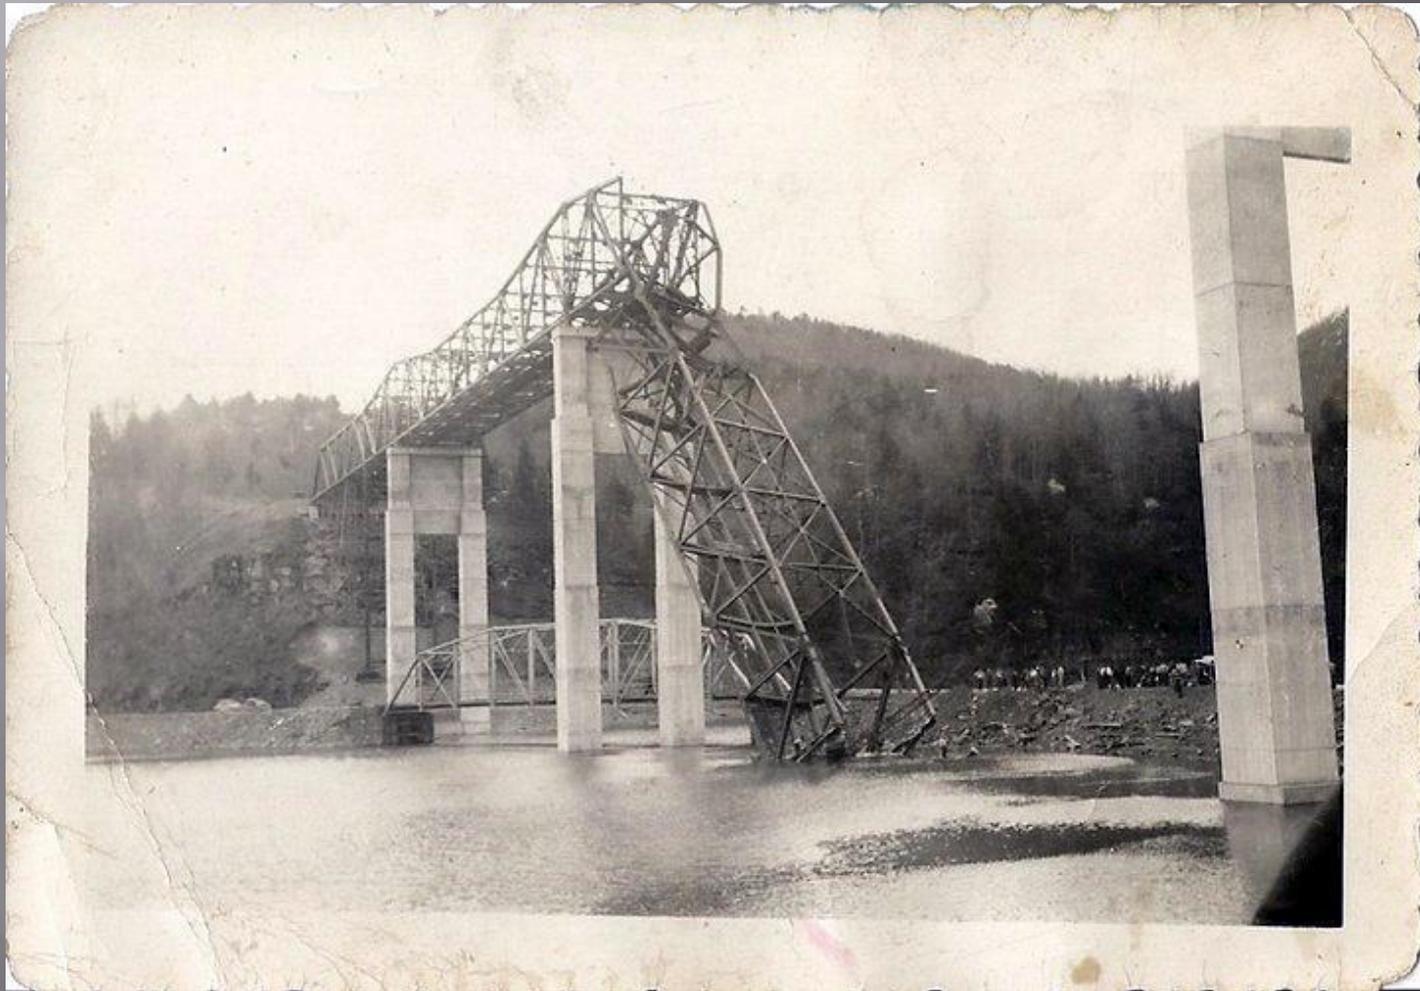

Lilly Bridge Collapse during 1948 Construction

The bridge was a 5-span cantilevered thru-truss supported by concrete abutments and 4 concrete piers. Span 3 and 4 fell in 1948 during construction, killing several workers.

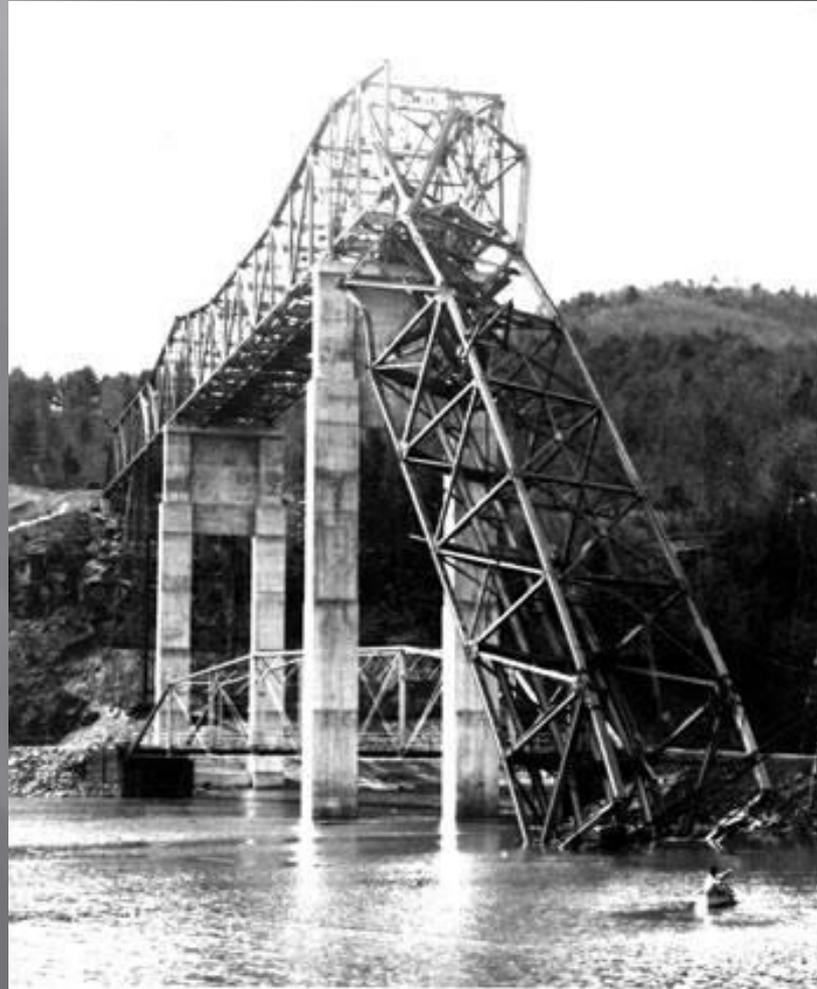

Career steel erector and crane operator Tommy Lilly offered a possible cause of the collapse:

At the time of the Lilly Bridge collapse, all bridges were of box girder design, the span would support itself as long as all the rivets, braces, etc. were tight and there was not too much excess weight on the cantilevered end. They used a stiff leg derrick on the structure to erect the steel. They were within feet of reaching the next pier, and they must of had too much weight on the very end of the structure, possibly, steel, kegs of rivets, rivet ovens, kegs of bolts and the structure buckled, twisted and fell into bluestone river.
